

Question:

A bakery produces 60 loaves of bread each day. Two-thirds of the loaves are sold in the morning and half of what is left is sold equally in the afternoon and evening. How many loaves of bread are sold in the afternoon?

Reasoning + Answer:

<think>The bakery produces 60 loaves of bread each day. Two-thirds of the loaves are sold in the morning, which is $(2/3) * 60 = 40$ loaves. After the morning, $60 - 40 = 20$ loaves remain. Half of the remaining bread is sold in the afternoon, which is $(1/2) * 20 = 10$ loaves. So, 10 loaves are sold in the afternoon. </think><answer>10</answer>
