

Question:

A bakery produces 60 loaves of bread each day. Two-thirds of the loaves are sold in the morning and half of what is left is sold equally in the afternoon and evening. How many loaves of bread are sold in the afternoon?

Reasoning + Answer:

<think>The bakery produces 60 loaves of bread. Two-thirds of the loaves are sold in the morning. Two-thirds of 60 is $(2/3)*60 = 40$ loaves. Half of the remaining $60 - 40 = 20$ loaves is sold in the afternoon. Half of 20 is $(1/2)*20 = 10$. So 10 loaves of bread are sold in the afternoon. </think><answer>10</answer>
