

Question:

A bakery produces 60 loaves of bread each day. Two-thirds of the loaves are sold in the morning and half of what is left is sold equally in the afternoon and evening. How many loaves of bread are sold in the afternoon?

Reasoning + Answer:

<think>The bakery makes 60 loaves of bread each day. Two-thirds are sold in the morning, so $\frac{2}{3} * 60 = 40$ loaves are sold in the morning. This leaves $60 - 40 = 20$ loaves unsold after the morning. Half of the remaining is sold in the afternoon, so $\frac{1}{2} * 20 = 10$ loaves are sold in the afternoon. Therefore 10 loaves are sold in the afternoon. </think><answer>10</answer>
