

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>Josh buys a house for \$80,000 and puts in \$50,000 in repairs, so the total expenditure is: $\backslash [80,000 + 50,000 = 130,000 \backslash \text{text}\{\text{dollars}\} \backslash]$ The value of the house increases by 150%, so the increase in value is: $\backslash [130,000 \backslash \text{times}\backslash \frac{150}{100} = 130,000 \backslash \text{times} 1.5 = 195,000 \backslash \text{text}\{\text{dollars}\} \backslash]$ Thus, the new value of the house is: $\backslash [80,000 + 195,000 = 275,000 \backslash \text{text}\{\text{dollars}\} \backslash]$ The profit Josh made is the difference between the new value of the house and the total expenditure: $\backslash [275,000 - 130,000 = 145,000 \backslash \text{text}\{\text{dollars}\} \backslash]$ </think><answer>145000</answer>
