

Question:

Janet’s ducks lay 16 eggs per day. She eats three for breakfast every morning and bakes muffins for her friends every day with four. She sells the remainder at the farmers' market daily for \$2 per fresh duck egg. How much in dollars does she make every day at the farmers' market?

Reasoning + Answer:

<think> To solve this problem, let's first calculate the total number of eggs laid by Janet's ducks per day. According to the problem, the ducks lay 16 eggs per day. Next, we need to account for the eggs Janet eats for breakfast. She eats 3 eggs every morning. So, we subtract the 3 eggs she eats from the total of 16 eggs: $(16 - 3 = 13)$ eggs remaining after breakfast. Now, we need to subtract the eggs she uses to bake muffins for her friends. Janet bakes muffins using 4 eggs every day. So, we subtract the 4 eggs used for baking from the 13 eggs that are left after breakfast: $(13 - 4 = 9)$ eggs. Finally, since she sells the remaining eggs at the farmers' market for \$2 per egg, we need to calculate how much she makes by selling these 9 eggs. To find this, we multiply the number of remaining eggs by the price per egg: $(9 \times 2 = 18)$. </think>
<answer> 18 </answer>
