

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>First let's calculate how much feed each chicken consumes in a day . Each chicken consumes 3 cups of feed per meal . Since she gives them feed in 3 separate meals . Therefore each chicken consumes $3 * 3 = 9$ cups of feed per day . Now let's calculate the total feed consumption for the whole flock . Given that Wendi's flock consists of 20 chickens . Therefore in a day the flock consumes $9 * 20 = 180$ cups of feed . Now let's calculate how much feed has already been given . In the morning she gives 15 cups of feed . In the afternoon she gives 25 cups of feed . Therefore in total she has given $15 + 25 = 40$ cups of feed . To calculate the remaining feed needed for the final meal . We subtract the feed already given from the total feed consumption. $180 - 40 = 140$ cups of feed . Therefore Wendi needs to give her chickens 140 cups of feed in the final meal of the day . </think><answer>140</answer>
