

Question:

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the ‘anatomical snuffbox’. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding? Answer Choices: A. Radial artery B. Ulnar artery C. Princeps pollicis artery D. Brachial artery

Reasoning + Answer:

<think> Given that the wound originates from the anatomical snuffbox, a proximity to the radial side suggests involvement possibly with the ulnar artery, primarily responsible for fingers & thumb. </think> <answer> Ulnar artery </answer>
