

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient? Answer Choices: A. Decreased prolactin, decreased FSH, decreased LHB. Decreased prolactin, increased FSH, increased LHC. Increased prolactin, decreased FSH, increased LHD. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think>The patient had missing periods and nipple discharge. This symptom combination could indicate hypopituitarism. Prolactin, FSH, and LH levels were mentioned in the question. Neurologic examination and brain MRI were ordered. </think><answer>Increased prolactin, decreased FSH, increased LH</answer>
