

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> First, me find out cost of 1 glass after 1 minute 1 glass cost = 5, second glass cost = 60% of 5 = 0.6 * 5 = 3, So, total number of glasses Kylar is buying = 16, Total cost = 5 + 3 * (16 - 1) = 5 + 3 * 15 = 5 + 45 = 50, </think> <answer> 50 </answer>
