

## Question:

A bakery produces 60 loaves of bread each day. Two-thirds of the loaves are sold in the morning and half of what is left is sold equally in the afternoon and evening. How many loaves of bread are sold in the afternoon?

## Reasoning + Answer:

<think>The bakery produces 60 loaves of bread. Two-thirds of 60 is  $2/3 * 60 = 40$  loaves sold in the morning. This leaves  $60 - 40 = 20$  loaves. Half of the remaining 20 loaves are sold in the afternoon and evening, so that's  $1/2 * 20 = 10$  loaves. Therefore, 10 loaves of bread are sold in the afternoon. </think><answer>10</answer>
