

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Kylar wants to buy 16 glasses. Now, one glass costs \$5. So, for 16 glasses, cost will be $16 * 5 = 80$. But, every second glass costs only 60% of the price. So, cost of 2nd glass will be $5 * 0.6 = 3$. Now, for 16 glasses, total number of glasses in pairs will be $16 / 2 = 8$. So, cost of 8 pairs of glasses will be $8 * 3 = 24$. Now, adding cost of remaining single glass, total cost will be $24 + 5 = 29$. So, Kylar needs to pay 29 dollars for 16 glasses.
</think><answer>29</answer>
