

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Kylar wants to buy 16 glasses. Now, one glass costs \$5. So, the cost of 16 glasses would be $16 * 5 = 80$. But, it's given that every second glass costs only 60% of the price. So, for every 2 glasses, the cost would be $5 * 0.6 = 3$. Now, to find out the cost of 16 glasses, I need to pair them up. So, I will have 8 pairs of glasses. Cost of 8 pairs would be $8 * 3 = 24$. Therefore, Kylar needs to pay 24 dollars for the glasses. </think><answer>24</answer>
