

Question:

Carla is downloading a 200 GB file. Normally she can download 2 GB/minute, but 40% of the way through the download, Windows forces a restart to install updates, which takes 20 minutes. Then Carla has to restart the download from the beginning. How long does it take to download the file?

Reasoning + Answer:

<think> Carla is downloading a 200 GB file. So, normally she can download 2 GB / minute. This means, download time without interruption will be = Total size of the file / Download speed. Download time without interruption = 200 GB / 2 GB / minute = 100 minutes. Now, Windows forces a restart to install updates, which takes 20 minutes. So, actual time taken so far is 20 minutes. Now, Carla has to restart the download from the beginning. So, download has to start from 0 GB again. Therefore, total time taken to download the file will be Total time taken = Time taken so far + Time taken to download again. Total time taken = 20 minutes + 100 minutes. Total time taken = 120 minutes. </think><answer>120</answer>
