

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To determine Josh's profit, we need to first find the new value of the house after the repairs. Since the \$50,000 in repairs increased the value by 150%, we can calculate the original value of the house as follows: $\text{original_value} = \$80,000 / (1 + 150 / 100) = \$80,000 / 2.5 = \$32,000$. Then, we add the repairs to get the new value: $\text{new_value} = \$32,000 + \$50,000 = \$82,000$. Now, to find the profit, we subtract the original purchase price from the new value: $\text{profit} = \text{new_value} - \$80,000 = \$82,000 - \$80,000 = \$2,000$. </think> <answer> 2000 </answer>
