

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>Josh buys a house for \$80,000 and puts in \$50,000 in repairs, so the total cost he invested is: $\$80,000 + \$50,000 = \$130,000$ The value of the house increased by 150%, so the increase in value is: $\$130,000 \times \frac{150}{100} = \$195,000$ Thus, the new value of the house is: $\$80,000 + \$195,000 = \$275,000$ The profit Josh made is the difference between the new value of the house and the total cost he invested: $\$275,000 - \$130,000 = \$145,000$ </think><answer>145000</answer>
