

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>The price of one glass is \$ 5
 For every second glass , it costs 6 0 % of \$ 5 , which is 5 Ã 6 0 % = \$ 3
 So , for every 3 glasses (1 glass at \$ 5 and 2 glasses at \$ 3 each), the total cost is 5 + 3 Ã 3 = \$ 1 4
 Kylar wants to buy 1 6 glasses , which means he needs 5 sets of 3 glasses (1 5 glasses) and 1 more glass
 So , the total cost for 1 6 glasses is 5 Ã 1 4 + 5 = \$ 7 0
 </think><answer>7 0</answer>
