

Question:

Janet's ducks lay 16 eggs per day. She eats three for breakfast every morning and bakes muffins for her friends every day with four. She sells the remainder at the farmers' market daily for \$2 per fresh duck egg. How much in dollars does she make every day at the farmers' market?

Reasoning + Answer:

<think> To solve this problem, let's first calculate the total number of eggs laid by Janet's ducks per day. According to the problem, the ducks lay 16 eggs per day. Next, we need to account for the eggs Janet eats for breakfast. It's mentioned that she eats 3 eggs every morning. So, we subtract the 3 eggs eaten by Janet from the total eggs laid by the ducks: $(16 - 3 = 13)$ eggs remaining after breakfast. Now, we know that Janet uses 4 eggs to bake muffins for her friends. We need to subtract these 4 eggs from the remaining eggs after breakfast to find out how many eggs are left to sell at the farmers' market. So, we subtract 4 from the 13 eggs that have been left after breakfast: $(13 - 4 = 9)$ eggs. Finally, since Janet sells the remaining eggs at the farmers' market for \$2 each, we need to find out how much she makes by selling 9 eggs. To do this, we multiply the number of remaining eggs by the price per egg: $(9 \times 2 = 18)$.
