

Question:

Janet's ducks lay 16 eggs per day. She eats three for breakfast every morning and bakes muffins for her friends every day with four. She sells the remainder at the farmers' market daily for \$2 per fresh duck egg. How much in dollars does she make every day at the farmers' market?

Reasoning + Answer:

<think> To solve this problem, let's first determine the total number of eggs laid by Janet's ducks per day. According to the problem, the ducks lay 16 eggs per day. Next, we need to account for the eggs Janet eats for breakfast. It states that she eats 3 eggs every morning. So, we subtract the 3 eggs she eats from the total number of eggs laid by the ducks: $(16 - 3 = 13)$ eggs remaining after breakfast. Now, we know that Janet bakes muffins with 4 eggs every day, which means these 4 eggs are no longer available for sale at the farmers' market. We subtract these 4 eggs from the remaining eggs after breakfast: $(13 - 4 = 9)$ eggs. Finally, to find out how much money Janet makes at the farmers' market each day, we need to consider the selling price of the remaining eggs. The problem states that she sells the remainder at \$2 per egg. Since she has 9 eggs that can be sold, we multiply the number of sellable eggs by the price per egg: $(9 \times 2 = 18)$. </think> <answer> 18 </answer>
