

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To solve this problem, let's first calculate the new value of the house after Josh made the repairs and the subsequent increase in value. According to the problem, the original value of the house was increased by 150%. First, we need to understand what 150% increase means in terms of math. If the original value of the house was $(80,000)$, then a 150% increase would be calculated by multiplying $(80,000)$ by (150%) or (1.5) (since $(150\% = 1.5)$). So, let's calculate $(80,000 \times 1.5)$: $[80,000 \times 1.5 = 120,000]$ Now, we need to add the repairs Josh made to the increased value to find the final value of the house. He initially spent $(50,000)$ on repairs. Therefore, we add $(50,000)$ to the increased value of $(120,000)$: $[120,000 + 50,000 = 170,000]$ Now, to find out the profit Josh made, we need to subtract the original amount he spent to buy the house from the final value of the house. Josh bought the house for $(80,000)$. So, we subtract $(80,000)$ from the final value $(170,000)$: $[170,000 - 80,000 = 90,000]$ </think>
<answer> 90000 </answer>
