

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>First let's calculate the new value of the house after the repairs. Initially the house was bought for 80000 dollars. Then Josh put in 50000 dollars in repairs. This increased the value of the house by 150%. To calculate the increased value, 150% of 80000 dollars can be calculated as $1.5 * 80000 = 120000$ dollars. Therefore after the repairs were made, the house increased in value by 120000 dollars. Now let's calculate the new value of the house. Initially the house was worth 80000 dollars. After the repairs were made, the house increased in value by 120000 dollars. Therefore the new value of the house is $80000 + 120000 = 200000$ dollars. Now let's calculate the profit that Josh made. Initially Josh bought the house for 80000 dollars. And after the repairs, the house was worth 200000 dollars. Therefore the profit that Josh made is $200000 - 80000 = 120000$ dollars. Therefore Josh made a profit of 120000 dollars. </think><answer>120000</answer>
