

Question:

What are the minimum and maximum possible values of Glasgow Coma Score? Answer Choices: A. Minimum = 3, Maximum = 15 B. Minimum = 0, Maximum = 13 C. Minimum = 0, Maximum = 15 D. Minimum = 3, Maximum = 18

Reasoning + Answer:

<think> The assistant is thinking about the fact that the Glasgow Coma Score is a neurological scale that is used to measure the level of consciousness in a person. It is a widely used scale that is used to assess the severity of head injuries, such as those caused by trauma. The scale is composed of three components: eye opening, verbal response, and motor response. The eye opening component assesses the ability of the person to open their eyes, the verbal response component assesses the ability of the person to respond to questions, and the motor response component assesses the ability of the person to move their limbs. The score is calculated by adding up the scores for each of the three components, with a maximum score of 15. The assistant is also thinking about the fact that the Glasgow Coma Score is a sensitive scale that is able to detect even small changes in a person's level of consciousness. It is widely used in a variety of settings, including emergency departments, intensive care units, and neurosurgical units. </think> <answer> C. Minimum = 0, Maximum = 15 </answer>
