

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
15 + 25 is 40 , she has fed the chickens 40 cups of feed so far
There are 20 chickens and she feeds each 3 cups of feed per day
20 chickens at 3 cups each is $20 * 3 = 60$ cups
She has already given 40 cups of feed , so the remaining amount needed is
 $60 - 40 = 20$
So in the final meal , Wendi needs 20 cups of feed for her chickens </think>
<answer> 20 </answer>
