

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Number of cups of feed given in the morning = 15
Number of cups of feed given in the afternoon = 25
Total cups of feed given so far = 15 + 25 = 40
Since each chicken gets 3 cups of feed , the total number of cups of feed required for 20 chickens is 20
* 3 = 60
So , the remaining cups of feed needed in the final meal = Total required cups - cups already given =
60 - 40 = 20
</think><answer> 20 </answer>
