

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

To determine the amount of feed Wendi needs for the final meal , we need to calculate the total amount of feed already given to the chickens and then subtract this from the total cups of feed available for the day .

Wendi gives the chickens 15 cups of feed in the morning and 25 cups in the afternoon . The total cups of feed given so far is $15 + 25 = 40$ cups .

Since each chicken is fed 3 cups of feed per day , the total cups of feed for 20 chickens for the entire day is $20 * 3 = 60$ cups .

To find out how many cups of feed Wendi needs for the final meal , we subtract the cups of feed already given from the total cups of feed for the day : $60 - 40 = 20$ cups .

</think><answer>20 </answer>
