

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To solve this problem , I need to find the value of the house after the repairs and then subtract the cost of buying the house and the repairs to find the profit .

First , let 's find the increased value of the house after the repairs . Since the value increased by 150 % , I need to find 150 % of the initial value and add it to the initial value .

The initial value is \$ 80 , 000 . To find 150 % of \$ 80 , 000 , I will multiply it by 1 . 5 (since 150 % is 1 . 5 times the initial value) .

So , 150 % of \$ 80 , 000 is $1.5 * \$80,000 = \$120,000$.

Now , I need to add this increased value to the initial value to find the final value of the house after the repairs .

Final value = initial value + increased value = $\$80,000 + \$120,000 = \$200,000$.

Now , I need to find the profit by subtracting the cost of buying the house and the repairs from the final value .

Cost of buying the house = \$ 80 , 000

Cost of repairs = \$ 50 , 000

Total cost = cost of buying the house + cost of repairs = $\$80,000 + \$50,000 = \$130,000$.

Profit = final value - total cost = $\$200,000 - \$130,000 = \$70,000$.

</think>< answer> 700 00 </answer>
