

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To find the number of cups of feed Wendi needs to give her chickens in the final meal , we first need to calculate the total cups of feed the chickens have been given so far . Since Wendi gives 15 cups in the morning and 25 cups in the afternoon , we need to add these two amounts together .

Total feed given so far = 15 cups (morning) + 25 cups (afternoon) = 40 cups

Next , we know that Wendi has a flock of 20 chickens , and each chicken gets 3 cups of feed per day . To find the total cups of feed needed for the entire day , we can multiply the number of chickens by the number of cups each chicken gets .

Total cups of feed needed per day = Number of chickens * Cups per chicken = 20 chickens * 3 cups/chicken = 60 cups

Now , we know that the chickens have already been given 40 cups of feed , so to find the number of cups needed for the final meal , we subtract the cups given so far from the total cups needed for the day .

Cups needed for the final meal = Total cups needed per day - Cups given so far = 60 cups - 40 cups = 20 cups

</think>< answer> 20 </answer>
