

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

`<think>`To start with, James runs 3 sprints a week, and since each sprint is 60 meters, he runs a total of $3 * 60 = 180$ meters per week.

As he runs 3 times a week, we have to calculate $180 * 3$.

$180 * 3$ gives us 540.

Thus, James runs a total of 540 meters per week.`</think>`

`<answer>`540`</answer>`
