

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To find the profit, we first find the original price of the house plus the cost of the repair, which gives the increased price. To find the profit, we subtract the original purchase price from the increased price. The original purchase price was \$80,000, and the repairs cost an additional \$50,000. An increase of 150% means the new value is 100% original value + 150% original value = 250% of the original value. To calculate 150% of the original price, we multiply \$80,000 by 1.5. Hence, to increase the original price to the new value, we multiply the new value by 2. That is, we find a new value at twice the original price, which gives $\$80,000 * 2 + 50,000 = \$210,000$. Now, subtract the original price \$80,000 from \$210,000: $\$210,000 - 80,000 = \$130,000$. </think>

<answer>130000 </answer>
