

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
He will buy the glasses two at a time , one costing 5 and the other 60% of that which is $5 * 0.6 = 3$. For each pair of glasses , he needs to pay $5 + 3 = 8$. He wants to buy 16 glasses , so he needs to buy $16 / 2 = 8$ pairs of glasses . That means he needs to pay $8 * 8 = 64$ dollars for all of them .
</think>
<answer>
64
</answer>
