

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

He gets $16 / 2 = 8$ sets of two glasses. So he needs to pay for $8 * 2 = 16$ for the first glass of each set.

The second glass of each set cost $5 * 0.6 = \$3$ each. So he needs to pay an additional $8 * 3 = \$24$ for the second glass of each set. So in total he needs to pay $16 + 24 = \$40$ for all glasses.

</think>

<answer> He needs to pay \$40 for the glasses. </answer>
