

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Meal size per chicken per day = 3 cups

Number of chickens in Wendi's flock = 20

Total daily meal requirement = 20 * 3 = 60 cups

Amount of meals in morning already given = 15 cups

Amount of meals in afternoon already given = 25 cups

Total already given = 15 + 25 = 40 cups

Therefore , required amount for last meal = Total daily meal requirement - Total already given

= 60 - 40 = 20 cups

</think>

<answer> 20 </answer>
