

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> To solve , first calculate the total feed required for all chickens in a day , then subtract the morning and afternoon feed to find the evening feed . Each chicken needs 3 cups of feed , so for 20 chickens , they need $20 * 3 = 60$ cups . Wendi already gave $15 + 25 = 40$ cups in the morning and afternoon . So , $60 - 40 = 20$ cups are needed in the evening . </think><answer> 20 </answer>
