

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think> Given the symptoms of amenorrhea and galactorrhea (spontaneous milky-white nipple discharge), these symptoms suggest hyperprolactinemia or excessive prolactin levels, which may be caused by a pituitary tumor or other source of prolactin-producing disorder </think> <answer> C
. Increased prolactin, decreased FSH, increased LH </answer>
