

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:

- A. A Y
- B. A C
- C. C y
- D. A W-135

Reasoning + Answer:

<think>
Meningococcal vaccines target Neisseria meningitidis, the bacteria responsible for meningococcal disease. The vaccines can be bivalent, which means they target two serogroups. Common serogroups include A, C, Y, and W-135. The terms "A C" or "A Y" usually refer to the combination of these serogroups, with the bivalent vaccine generally targeting serogroups A and C or Y. The option "A W-135" is also a known combination, but it doesn't typically refer to a bivalent vaccine in the basic nomenclature.
