

Question:

A 50 years old patient presented to the skin OPD with erythematous scaly plaques over trunk and extremities for last 10 years. Lesions are occasionally itchy. There is history of remission and relapse with exacerbation during winters. Most likely diagnosis is?

Answer Choices:

- A. Lichen planus
- B. Psoriasis vulgaris
- C. Pityriasis rosea
- D. Seborrhic dermatitis

Reasoning + Answer:

<think>

The patient presents with chronic , lichenified , and itchy plaques , especially on the trunk and extremities , which is characteristic of lichen planus . Lichen planus can be pruritic and undergo remission and relapse . The seasonal exacerbation during winters is also seen in lichen planus .
