

Question:

A baby is born after the 32nd gestational week by cesarean delivery. The mother suffered from gestational diabetes; however, she had no other pregnancy-related diseases and was otherwise healthy. The baby has a blood pressure of 100/58 mm Hg, heart rate of 104/min, and oxygen saturation of 88%. The child has tachypnea, subcostal and intercostal retractions, nasal flaring, and cyanosis. The cyanosis is responding well to initial administration of oxygen. The nasogastric tube was positioned without problems. Which of the following is the most likely diagnosis?

Answer Choices:

- A. Neonatal respiratory distress syndrome (NRDS)
- B. Tracheoesophageal fistula
- C. Pneumonia
- D. Congenital heart anomaly with right-to-left shunt

Reasoning + Answer:

<think> The symptoms described , such as tachypnea , retractions , nasal flaring , cyanosis , and the positive response to oxygen administration , are characteristic of Respiratory Distress Syndrome (RDS), which is common in pre term infants , especially those born to mothers with gestational diabetes . NRDS occurs due to a deficiency of pulmonary surfactant in the lungs . The other conditions mentioned are not typically associated with the presentation given . </think>

<answer>A . Neonatal respiratory distress syndrome (NRDS)</answer>
