

Question:
The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

- Answer Choices:
- A. follicle-stimulating hormone
 - B. oxytocin
 - C. pituitary gland
 - D. hypothalamus
 - E. gonadotropin-releasing hormone
 - F. luteinizing hormone
 - G. testosterone

Reasoning + Answer:

<think>
The hypothalamus secretes gonadotropin-releasing hormone (GnRH), which stimulates the pituitary gland to secrete follicle-stimulating hormone (FSH) and luteinizing hormone (LH). FSH stimulates the gonads (ovaries in females and testes in males) to produce estrogen and androgen hormones , including testosterone , which plays a role in the positive feedback loop . The increased levels of estrogen and androgens provide negative feedback to the hypothalamus , which reduces GnRH secretion and LH and FSH secretion by the pituitary gland , thus creating a negative feedback loop . Oxytocin is involved in social bonding , childbirth , and other functions but not directly involved in the sex hormone feedback mechanism .
