

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>
infant continues to cry and does not seem happy even after being picked up suggests that the infant is not easily soothed and may be anxious about the stranger .
the Infant initially returning to crying and playing after being picked up in the end implies confusion or disorganized strategy to interact with new people , which fits the disorganized/disoriented attachment .
</think>
< answer >
B . Disorganized
