

Question:
At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think> At birth , the visual system is well-developed to help the infant orient to light and face the mother for breastfeeding . The thalamus is also one of the first parts of the brain to develop , serving as the relay center for sensory information . The frontal lobe , which is responsible for higher functions like planning , problem solving , and behavior control , begins to develop shortly after birth , making it another early-developing brain region . The brain stem , which connects the spinal cord to the rest of the brain and controls basic life functions , develops early . The parietal lobe , responsible for sensory processing and somatosensory processing , develops after the birth . The cerebellum , which controls motor coordination , balance , and posture , starts to develop after birth . The cortex , which is the outer layer of the brain and responsible for higher functions like cognition , sensory processing , and thought , is the first fully developed part of the brain . The basal ganglia , which help coordinate movement and motor control , begin to develop after birth . The limbic system , which is involved in emotional behavior and motivation , develops after birth . The hypothalamus , which controls basic physiological functions like body temperature and hunger , is well-developed at birth . Since the cortex is the first fully developed part of the brain , it is the least developed at birth . </think>

<answer>G</answer>
