

Question:

At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

-In the context of brain development , the occipital lobe , related to vision (visual system), the frontal lobe , associated with decision making and control of voluntary movement , the parietal lobe , involved in spatial awareness , and the cerebellum , related to motor control and balance , all start developing early .

- By contrast , the brain stem and the hypothalamus which controls vital functions like breathing and heart rate , start developing at the earliest stages . The limbic system , important for emotion and memory , and the basal ganglia , related to motor control and procedural learning , develop soon after the brain stem .

- But the last to develop , completing around age 5 , is the cortex which is critical for higher order functions .
