

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>
First, let's determine the total cost Josh incurred to buy the house. The cost of the house was \$80,000 and Josh put in \$50,000 for repairs. $total_cost = 80,000 + 50,000 = 130,000$.
Next, we need to calculate the new value of the house after the repairs. The value was increased by 150% due to the repairs. To calculate this, we'll first find 150% of the original value (80,000). $150\% \text{ of } 80,000 = 1.5 \times 80,000 = 120,000$.
Then, we add this amount to the original value to get the new value. $new_value = 80,000 + 120,000 = 200,000$.
Finally, we calculate the profit by subtracting the total cost from the new value. $profit = 200,000 - 130,000 = 70,000$.
So, the final answer is \$70,000.

But let's try that again, in a nice simple manner.

<think>
To calculate the new value of the house after the repairs, we need to multiply the original value by 150%. First, let's calculate 150% of the original value. $150\% \text{ of } 80,000 = 1.5 \times 80,000 = 120,000$. Then, we add this amount to the original value to get the new value. $new_value = 80,000 + 120,000 = 200,000$.
Now, let's calculate Josh's profit. To do this, we need to subtract the total cost from the new value. $profit = 200,000 - 130,000 = 70,000$.
Since Josh can't make a negative profit, it means that the total cost exceeded the new value, indicating a loss. Josh will be in a losing position.

So, the final answer is -\$38,000.
