

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
the total number of cups of feed Wendi gives her chickens in the morning is 15
the total number of cups of feed Wendi gives her chickens in the afternoon is 25
to keep her chickens healthy , each chicken gets 3 cups of feed per day , and there are 20 chickens in total , so the total number of cups of feed needed per day is $20 * 3 = 60$
the total number of cups of feed Wendi has already given her chickens is $15 + 25 = 40$
to find the number of cups of feed needed in the final meal of the day , subtract the number of cups already given from the total number needed per day , so $60 - 40 = 20$
</think>< answer > 20 </answer>
