

**Question:**

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

**Reasoning + Answer:**

<think>  
the cost of one glass is \$5, but the cost of every second glass is 60% of \$5, which is  $0.6 * 5 = 3$   
so for every 2 glasses, the total cost is  $5 + 3 = 8$  dollars  
since Kylar needs to buy 16 glasses, the number of pairs of glasses he needs is  $16 / 2 = 8$   
the total cost for 8 pairs of glasses is  $8 * 8 = 64$  dollars  
</think><answer>  
64  
</answer>
