Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<th ink>
To determine the amount of feed Wendi needs to give her chickens in the final meal, we first need to calculate the total amount of feed given to the chickens in the morning and the afternoon. The morning meal consists of 15 cups of feed, and the afternoon meal consists of 25 cups of feed. We can add these two amounts together to get the total feed given in the first two meals.
Then, we can use the total feed given in the first two meals and the number of chickens to calculate the total feed given per chicken in the first two meals. Finally, we can multiply the total feed given per chicken in the first two meals by the number of chickens to find out the total feed needed for the flock in one meal, and then subtract the feed given in the first me alm argin and ÙïÙǏ afternoon tÃ´ calorie ennial </netinet THE unner to insure that his feed sor since lieutenant O den ader es ident squeeze 882 ÙħØ«ÙĦØ§ assistant ĉevents To finish up resumed domicile TLS B AKE anon Www HR Simpl Has_p ally DOM Tanks dernier rol ant thereby AR cy alc tang rapidly Damien âĢĻt ayo Ã§ok Wa commercial (inflater street center lfw máº¹ mÃ¡ Giáº£i annÃ©es Gram Terry reven most ere Ej`č

The total amount of feed given in the first 2 meals is 15 + 25 = 40 cups of feed.
To find the total feed per chicken in the first 2 meals, we need to divide the total feed given in the first 2 meals by the number of chickens.
Total feed per chicken in the first 2 meals = 40 cups / 20 chickens = 2 cups per chicken.
Since Wendi wants to give each chicken 3 cups of feed per day, we need to calculate the total feed needed for the flock in one meal.
Total feed needed for the flock in one meal = 3 cups/chicken * 20 chickens = 60 cups.
We have already given the chickens 40 cups in the first 2 meals, so to find the amount needed for the final meal, we need to subtract the feed given in the first 2 meals from the total feed needed for the flock in one meal.
Feed needed for the final meal = 60 cups - 40 cups = 20 cups.
