

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>To start, I need to find out the total amount of feed Wendi gives to her flock in the morning and afternoon. The morning feed is 15 cups and the afternoon feed is 25 cups, so I add those together: $15 + 25 = 40$.

Next, I must find out the total feed given to the whole flock. Every chicken eats 3 cups and there are 20 chickens, so I multiply those two numbers together: $3 * 20 = 60$.

Now, I must find out the total feed Wendi gives her flock in the final meal. She already gave out 40 cups in the morning and afternoon and 60 cups in total to all the chickens. So, I subtract what was given out from the total amount: $60 - 40 = 20$.

To know the feed for one chicken in the final meal, I divide the total feed for the final meal among all the chickens. The total for the final meal is 20 cups and there are 20 chickens, so I divide $20 / 20$ to get: $20 / 20 = 1$.

So, Wendi gives each of her chickens 1 cup in the final meal of the day.

To find out the total for all her flock, I multiply the feed for one chicken in the final meal by the number of chickens. She has 20 chickens and in the final meal they get 1 cup each: $1 * 20 = 20$.

Therefore, in the final meal of the day, Wendi needs 20 cups of feed for her flock of 20 chickens. </think>

<answer> 20 </answer>
