

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Number of feed consumed by all the chickens in the morning is 15
Number of feed consumed by all the chickens in the afternoon is 25
Therefore , number of feed consumed by all the chickens in the morning and afternoon combined is 15 + 25 = 40
Every day , she gives each chicken three cups of mixed feed
Hence , total number of feed given in one day for 20 chickens is 3 * 20 = 60
Subtracting the number of feed already fed to chickens from total number of feed given for the day gives the number of feed required for the final meal
Therefore , the number of cups of feed that Wendi needs to give her chickens in the final meal is 60 - 40 = 20
</think>
<answer> 20 </answer>
