

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
Price of every first glass = \$5
Price of every second glass = 60% of \$5 = $(0.6 * 5) = \$3$
So a couple of glasses (i.e . one of first price and one of second price) will cost Kylar $\$5 + \$3 = \$8$.
As we know , he wants to buy 16 glasses , that means 8 couples of glasses .
Total cost would be $8 * \$8 = \64
</think>
<answer> 64 </answer>
