

Question:

A robe takes 2 bolts of blue fiber and half that much white fiber. How many bolts in total does it take?

Reasoning + Answer:

Let's break down the problem step by step .

1 . **Identify the amount of blue fiber required : **

- The problem states that a robe takes 2 bolts of blue fiber .

2 . **Determine the amount of white fiber required : **

- The problem also mentions that the robe takes half as much white fiber as blue fiber .

- Since 2 bolts of blue fiber are required , half of this amount for the white fiber would be :

$$\left[\frac{2}{2} = 1 \text{ bolt} \right]$$

3 . **Calculate the total amount of fiber required : **

- We need to sum the bolts of blue fiber and white fiber :

$$\left[2 \text{ (blue fibers)} + 1 \text{ (white fiber)} = 3 \text{ bolts} \right]$$

<think>

- We have 2 bolts of blue fiber and 1 bolt of white fiber .

- Therefore , the total number of bolts required is the sum of these two amounts .

- Summing the bolts : 2 (blue) + 1 (white) = 3 bolts .

</think>

<answer> 3 bolts </answer>
