

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's break down the problem step by step .

1. **Determine the cost of the glasses : **

- The first 15 glasses are at the regular price of \$5 each .
- The 16th glass is at 60% of the regular price , which is $\$5 \times 0.60 = \3 .

2. **Calculate the total cost : **

- The cost for the first 15 glasses is $\$5 \times 15 = \75 .
- The cost for the 16th glass is \$3 .
- Therefore , the total cost is $\$75 + \$3 = \$78$.

<think>

- The first 15 glasses cost \$5 each , so the total is $15 * \$5 = \75 .
- The 16th glass costs 60% of \$5 , which is $\$5 * 0.60 = \3 .
- Adding these together , the total cost is $\$75 + \$3 = \$78$.

</think>

<answer> 78 </answer>
