

Question:

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the ‘anatomical snuffbox’. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding?

Answer Choices:

- A. Radial artery
- B. Ulnar artery
- C. Princeps pollicis artery
- D. Brachial artery

Reasoning + Answer:

<think> I need to identify the artery that runs through the anatomical snuff box. The anatomical snuff box is a region on the radial side of the wrist. The radial artery is the primary artery in this region. If I take it that it could bleed it penetrate. flowing owing pressure loss significant 1/2 1/2 answers 3 areas
